of Transportation

Federal Aviation  
Administration

# Advisory Circular

---

**Subject:** SPECIFICATION FOR L-82 1, PANELS FOR CONTROL OF AIRPORT LIGHTING      **Date:** 9/1/98      **AC No.:** 150/5345-3E  
**Initiated by:** AAS-200      **Change:**

---

**1. PURPOSE.** This advisory circular (AC) provides the specified manufacturing requirements for panels used for remote control of airport lighting and auxiliary systems.

**2. EFFECTIVE DATE.** Effective six months after the issue date of this AC, only that equipment qualified in accordance with the specifications herein will be listed in accordance with AC **150/5345-53**, *Airport Lighting Equipment Certification Program*.

**3. CANCELLATION.** AC **150/5345-3D**, *Specification for L-821 Panels for Remote Control of Airport Lighting*, dated August 8, 1986, is canceled.

**4. APPLICATION.** The standards contained in this AC are recommended by the Federal Aviation Administration (FAA) in all applications involving developments of this nature. The use of these standards is mandatory for airport projects receiving Federal funds under the airport grant assistance program and the passenger facility charge (PFC) program.

**5. PRINCIPAL CHANGES.**

Addition of control panel for stop bar lighting systems.

Addition of control panel for land and hold short operations (LAHSO) lighting systems.

Addition of lamp test control for each panel.

**6. METRIC UNITS.** To promote an orderly transition to metric units, this AC includes both English and metric dimensions. The metric conversions may not be exact equivalents, and until there is an official changeover to the metric system, the English dimensions will govern.

DAVID L. BENNETT  
Director of Airport  
Safety and Standards

FAA SPECIFICATION FOR L-821 PANELS  
FOR THE CONTROL OF AIRPORT LIGHTING

## 1. SCOPE AND CLASSIFICATION.

1.1 **Scope.** This specification sets forth the manufacturing requirements for panels to be used to control various airport lighting and auxiliary systems.

1.2 **Equipment Classification.** Two types, three classes, two styles, and three modes of panels are covered by this specification.

1.2.1 **Type.** Panels of the following types are covered by this specification:

Type	Description
I	Conventional panels. (See illustrations in Appendix IV, Figures 2, 3, 4, 5, and 6A).
II	Facsimile panels. (See illustrations in Appendix IV, Figures 6B and 7).

1.2.2 **Class.** Panels of the following classes are covered by this specification:

Class	Description
F	Flush mounted panels. Class F panels consist of a top plate attached to a case which is installed in a console in the airport control station (desk, counter, etc.) with the top plate flush with the surface of the control station. A typical case is shown in Appendix IV, Figure 8.
S	Surface mounted panels. Class S panels consist of a top plate and case for installation on an airport control station (desk, counter, etc.). A typical case is shown in Appendix IV, Figure 8.
W	Wall or surface mounted panels. Class W panels consist of a top plate and a commercial outlet or pull box for mounting in an electrical vault or other convenient control point at a small airport. A typical panel top plate is shown in Appendix IV, Figure 4.

1.2.3 **Style.** Panels of the following styles are covered by this specification:

Style	Description
1	Unlighted.
2	Backlighted.

1.2.4 **Mode.** Panels of the following modes are covered by this specification:

Mode	Description
1	Generic Panel. I.e. main lighting control panel. (See sample panels in Appendix IV, Figures 2 through 7).
2	Land and Hold Short Operations (LAHSO) Control Panel. (See illustration in Appendix IV, Figure 11).
3	Stop Bar Control Panel. (See illustration in Appendix IV, Figure 12).

## 2. REFERENCED DOCUMENTS.

2.1 **General.** The following is a listing of documents referenced in this AC.

### 2.2 FAA Advisory Circulars.

AC 150/5000-3	<i>Address List for Regional Airports Divisions and Airports District/Field Offices</i>
AC 150/5340-4	<i>Installation Details for Runway Centerline and Touchdown Zone Lighting Systems</i>
AC 105/5340-17	<i>Standby Power for Non-FAA Airport Lighting Systems</i>
AC 150/5340-24	<i>Runway and Taxiway Edge Lighting Systems</i>
AC 150/5340-28	<i>Low Visibility Taxi way Lighting Systems</i>
AC 150/5340-29	<i>Installation Details for Hold Short Lighting Systems</i>
AC 150/5345-53	<i>Airport Lighting Equipment Certification Program</i>
AC 120-57A	<i>Surface Movement Guidance and Control Systems</i>

### 2.3 Federal Standards.

FED-STD-595	<i>Colors</i>
-------------	---------------

### 2.4 Military Standards.

MIL-STD-81 OE	<i>Environmental Test Methods</i>
---------------	-----------------------------------

**Notes:** Copies of FAA ACs may be obtained from the Department of Transportation, General Services Division, M-45,400 7th Street SW., Washington, DC 20590. Phone (202) 267-3161/3115/8329. Some FAA ACs are available on the FAA Airports home page, [www.faa.gov/arp/arp/home.htm](http://www.faa.gov/arp/arp/home.htm).

Copies of Federal standards and specifications may be obtained from the General Services Administration (GSA), Federal Supply Service (FSS) office in Washington, DC. Phone (202) 619-8925 and Fax (202) 619-8978. The GSA FSS homepage, [www.fss.gsa.gov](http://www.fss.gsa.gov), contains more information on Federal publications. Copies may also be available at GSA regional and district offices.

## 3. GENERAL EQUIPMENT REQUIREMENTS.

**3.1 General Requirements.** The panels specified herein are intended for use in controlling various lighting and auxiliary systems as described in the documents listed in paragraph 2.2.

**3.2 Location.** The panels are generally installed in airport traffic control towers (ATCT). Airports without ATCTs should install panels at a convenient control location such as a hangar, office, or electrical vault.

**3.3 Panel Configurations.** Each control panel layout shall clearly identify the "ON" and "OFF" position of each switch or push button, the system each switch or push button controls, and, where appropriate, the intensity of the lighting system. Panel layouts are airport specific and shall be configured to accommodate unique user requirements at a particular airport. Panel lighting, including panel backlighting and illuminated switches, shall be illuminated such that they are visible when direct sunlight falls on the panel. Some examples of typical panel layouts using different switches and arrangements are shown in Appendix IV of this specification. The figures are

provided to show examples; physical conformance to the figures may not ensure that the panels comply with all applicable portions of this **specification**.

**3.2.1 Type I, Conventional Panels.** Switching of airport lighting and auxiliary systems may be accomplished in several ways. Figures are provided in Appendix IV of this AC to show some typical control panels. **Other** panel configurations will comply with this specification. The following table includes a description of the sample control panels illustrated in this AC:

Figure	Description
2 and 6A	Panel layouts with toggle switches for system controls with the exception of some intensity setting controls. Some of the system intensity settings are controlled with the five-position rotary switches.
3 and 4	Panel layouts with rotary switches for runway and/or <b>taxiway</b> lighting systems controls, including intensity settings, and toggle switches for other system controls.
5	Panel layout with all push button switches for system controls.

**3.2.2 Type II, Facsimile Panels.** Type II panels will primarily be Class F (flush mounted) panels. The layout of airport operating surface being controlled shall be engraved, painted, or overlaid by decal on the panel. Such surfaces include, but are not limited to, runways and taxiways. Other methods of labeling panel plates may be acceptable but must be approved by the FAA or the third party certification bodies listed in AC **150/5345-53** providing certification of the particular panel. (Approval method is described in Appendix III). Type II, Style 2, panel plates shall have appropriate facsimile sections of the airport surface backlighted as the switch that controls a particular system is activated (turned "ON"). When the system is de-activated (turned "OFF") the backlighting shall not be illuminated. Individual lighting sections controlled by various switches shall be color coded. Appendix IV, Figures 6A and 7 illustrate examples of the Type II, Style 2 panels. The shaded **taxiways** would appear in various colors and illuminate when the associated lighting circuit is activated.

### 3.3 Panel Components.

**3.3.1 Panel Plate.** Class F and S panel plates shall be made of **0.094-inch** (2.5 mm) steel or of other material of thickness or design that will provide like stiffness. The plate is to be attached to the case with a continuous hing along its top edge. A latch shall be mounted inside the case to provide support when the panel plate is open and at a near vertical position. No part of the plate or its attachments should project behind the plane of the back of the case during opening or closing. The panel plate for Class W panels may be a commercially available utility or outlet box cover that is usually attached to the case or box with screws. Therefore, for Class W, panels a latch and/or hinge is not required.

**3.3.2 Case or Box.** Class F and S panels shall have a suitable case made of not less than **0.078-inch** (2 mm) (nominal) sheet steel or aluminum of equal rigidity (see Figure 8 for examples). Commercially available outlets or pull boxes may be provided in lieu of a manufactured case for Class W panel plates. A grounding lug, capable of handling no. 12 AWG or larger conductor, shall be supplied in each case or box.

**3.3.3 Switches.** Switches are used to turn "ON" and "OFF" airport lighting regulators, beacons, obstruction lights, lighted wind indicators, apron lights, emergency power generators, and various lighting systems. Additionally, switches are used to control the intensity of intensity controlled lighting systems. The switches may be wired, programmed, or ganged for simultaneous operation of several lighting system circuits. Switches shall have a contact rating of 125% of the load current and shall be rated to meet the circuit voltage requirements. The life expectancy of the switches, at rated load, shall be at least 25,000 operations. Switches shall have screw, solder, or push-on type terminals. Typical switches are shown on panel layouts in Figures 2 through 7 and Figures 11 and 12.

**3.3.3.1 Toggle Switches.** Toggle switches shall have either two or three positions and, for most applications, be **detented** to provide positive-feel switching. Switches shall be mounted to operate **left** to right and wired such that

when the switch is in the far **left** position the lighting system is either “OFF” or “ON” with the intensity set to the lowest available intensity. Switches shall be mounted on the panel plate with a hexagonal nut above and below the panel plate using an internal-tooth lockwasher and a locking ring or keyed-punched panel to assure permanent mounting.

**3.3.3.2 Rotary Switches.** Rotary switches, used for the control of lighting systems, shall have three to six distinct positions with the appropriate number of poles to control the lighting system intensity. If required by the user, the rotary switch shall provide a pole to mm the systems “OFF.” The switches shall have a minimum angular throw of 30 degrees between detents and be equipped with a stop to prevent rotation past the last position. The switches shall rotate between detents in either direction without stopping.

**3.3.3.3 Push Button Switches.** Momentary or alternate action push button switches may be used to control any or all functions of airport lighting and auxiliary **systems**. The use of push button switches for intensity control will require auxiliary relays or non-radio interference solid state circuitry. Switches shall be wired so that when initially energized, the intensity setting of an intensity controlled lighting system is the lowest available intensity. When an intensity controlled lighting system is de-energizing, the intensity setting shall automatically return to the lowest intensity available. Illuminated push buttons should be softly backlit in an “OFF” position, and glow noticeably brighter in the “ON” position. A sample panel illustrating push button controls is shown in Appendix IV, Figure 5.

**3.3.4 Backlighting.** Backlighting of facsimile panels, switches, or switch designations shall be made with light sources with a life expectancy of at least 10,000 hours. A control to reduce the brightness of the panel backlighting up to 90 percent shall be provided. This brightness control shall not cause radio interference. A control shall be provided on each panel to test the panel lamps and illuminated switches.

**3.3.5 Emergency Generator Control.** Airport main lighting control panels shall include an emergency generator control switch that will transfer the power load from the main power supply to the emergency generator and a red pilot light that illuminates when the power load has been switched to the emergency generator.

**3.3.6 Wire and Wiring.** The wire shall have stranded copper conductors with adequate current capacity and a minimum rated insulation of 90° C. The wire size and insulation voltage rating shall be suitable for the design voltage and load. For identification purposes, all wires shall be either color coded or identified with wire markers. Wire markers shall be fixed such that they can not be accidentally removed and that they remain legible under normal conditions. All leads shall be properly strained and long enough to allow the plate to be raised to the extent permitted by the latch. All panels shall be wired with terminal connections in accordance with the applicable combination of components. Figure 9 shows the wiring diagram of the sample panel shown in Figure 2.

**3.3.7 Terminal Blocks.** Terminal blocks shall be pressure type terminal blocks and have a minimum rating equal to or greater than the rating of the wire. Each individual terminal shall be identified with permanent marks in accordance with the wiring diagram furnished with the unit. Terminal blocks may be omitted in Class W panels.

**3.3.8 Marking.** Switch designations shall be marked in characters not less than 3/16 inch (0.5 cm) and not over 5/16 inch (0.8 cm) high, formed by engraving, etching, or stamping. Unlighted characters shall be permanently marked. Markings shall be, a contrasting color from the marked surface, i.e. white surface with black marking, or black surface with white marking. Markings shall be placed either on the panel or on a small separate plate securely fastened to the panel. When push button switches are used, the marking may be on the switch itself but must be visible when the push button is in the “ON” or “OFF” position.

**3.3.9 Painting.** For Type F and S panels, the color and gloss of the case and panel plate shall conform to Federal Standard 595, brown No. 30372. Apply a hard, paint **finish** having a smooth texture, i.e. powder coating, baked epoxy, etc. The finished surface of the panel shall be suitable for indoor use and provide protection against circulating dust, falling dirt, and dripping non-corrosive liquids. An acceptable finish surface shall be **free** of runs, sags, etc. For Class W panels, the commercially applied **finish** to the utility box and cover will be acceptable.

**3.3.10 Wiring Diagram.** The manufacturer shall supply three copies of a wiring diagram with each panel. The wiring diagram shall show the color code or number identification of each wire and the proper connections.

**3.3.11 Parts List and Installation Instructions.** A component parts list and installation instructions shall be furnished with each control panel along with sufficient drawings or illustrations to indicate clearly the method of installation.

**3.3.12 Nameplate.** A nameplate showing the following information shall be attached to each panel:

- a. Airport Lighting Control Panel.
- b. Identification: FAA L-82 1.
- c. Type \_\_\_\_\_, Class \_\_\_\_\_, Style \_\_\_\_\_ Mode \_\_\_\_\_
- d. Manufacturer's Part no. \_\_\_\_\_
- e. Manufacturer's name or trademark.
- f. Date manufactured \_\_\_\_\_

#### **4. Mode 2, Land and Hold Short Operations (LAHSO) Control Panels.**

**4.1 LAHSO Lighting Systems.** Land and hold short lighting systems are lights used to provide visual reference to pilots during LAHSO. The details of the lighting system are in AC 150/5340-29. Control panels for the control of LAHSO lighting systems shall comply with the applicable requirements in paragraph 4.1 through 4.4 in addition to the other details in this AC which are not related to a specific panel.

**4.2 General Requirements.** The control panel shall be located in the ATCT. The panel shall contain an "ON/OFF" push button and a red fault indicator lamp for each LAHSO lighting system controlled at the panel. The LAHSO controls may be located on the airport's main lighting control panel. The fault light shall illuminate if any one of the faults defined in AC 150/5340-29 occurs. If the LAHSO panel is a dedicated panel separate from the main lighting control panel, panel backlighting shall comply with paragraph 3.3.4 of this AC and lighting system intensity controls shall not be provided on the LAHSO panel.

**4.3 Multiple LAHSO Systems on Separate Runways.** A control panel used to control multiple LAHSO lighting systems installed on separate runways shall provide one push button on the control panel for each system. A typical panel layout for this configuration is shown in Appendix IV, Figure 11 A.

**4.4 Multiple LAHSO Systems on the Same Runway.** A control panel used to control multiple LAHSO lighting systems installed on the same runway shall provide one push button for each system and a master switch. The master switch shall be a separate "ON/OFF" push button which turns the LAHSO control panel "ON" and "OFF". When the master switch is "ON", push buttons controlling the systems shall be energized, and when the master switch is "OFF", push buttons controlling the systems shall be de-energized. The push buttons used to activate the LAHSO lighting systems shall be interlocked allowing only one LAHSO lighting systems to be operating at any given time. The interlock design shall not allow simultaneous operations of controlled LAHSO lighting systems controlled from the same panel. Thus, when a push button for a LAHSO lighting system on a control panel is pressed and locked in the "ON" position the associated system is activated, all other LAHSO lighting system controlled from the same panel shall become inactive. However, the interlock shall not de-activate a lighting system when another system push button has been partially depressed and released prior to locking in the "ON" position. A typical panel layout for this configuration is shown in Appendix IV, Figure 11B.

**5. Mode 3, Stop Bar Control Panels.** Control panels for the control of stop bar lighting systems shall comply with the applicable requirements in 5.1 through 5.3.4.3 in addition to the other details in this AC which are not related to a specific panel.

**5.1 General Requirements.** The control panel shall be located in the ATCT. The stop bar control panel shall be a dedicated panel separate from the main airport lighting control panel. The panel shall include an "ON/OFF" switch for each stop bar to be controlled from the panel. Each switch on the panel shall be clearly labeled to indicate the function of the switch. The panel shall be activated and de-activated with a master control switch specified in 5.1.1.

**5.1.1 Master Controls.** A master control switch shall be located on the main lighting control panel to transition the applicable taxiway centerline lights, taxiway edge lights, runway guard lights, clearance bars, and stop bars to the appropriate SMC GS settings for low visibility operations. (See Surface Movement Guidance and Control System (SMCGS) operations in Appendix II for more information on low visibility operations). The master

control switch shall also activate the associated stop bar control panels. If the airport is approved for low visibility operations that do not require stop bars, it is recommended that the master switch be installed. The master switch shall variously transition the applicable **taxiway** centerline lights, **taxiway** edge lights, runway guard lights, clearance bars, and stop bars to the appropriate SMCGS settings when switched. For example, the switch settings may be “No SMCGS”, “Below 1200 RVR”, and/or “Below 600 RVR”. When the switch is in the “No SMCGS” position, the applicable **taxiway** centerline lights, **taxiway** edge lights, runway guard lights, clearance bars, and stop bars shall conform to the setting on the main lighting control panel, and all associated stop bars and stop bar control panels shall be de-energized. The appropriate SMCGS setting for the applicable lighting systems should be outlined in the airport’s SMCGS plan.

**5.1.2 Stop Bar Controls.** The stop bar control panel shall have a separate stop bar control switch to activate or de-activate each controlled stop bar on the airfield. A single stop bar control switch shall be for each runway on the panel to temporarily de-activate the uncontrolled stop bars on the applicable runway. The stop bar control switches shall be push buttons that comply with paragraph 5.3.1 of this AC.

## 5.2 Stop Bar Panel Configuration.

**5.2.1 Dimensions.** The minimum dimensions for the panel shall be 4 inches x 12 inches (100 mm x 300 mm) and the maximum dimensions shall be 12 inches x 16 inches (300 mm x 400 mm).

**5.2.2 Location.** The exact location of control panels are site specific with respect to operations, space, etc. The local air traffic facility should be consulted about the appropriate location for the control panel.

**5.2.3 Display.** The stop bar control panel shall include a diagram of the airport where the stop bars are located. The diagram shall be limited to relevant portions of the airport surface movement area; runways and associated **taxiways** shall be included. Where appropriate, designated taxi routes for low visibility operations should be included on the diagram. The diagram should allow for inclusion of additional stop bar controls and displays, if possible. Each stop bar position should be represented on the panel by three lights (per paragraph 5.3.2) which will indicate the “ON/OFF” status of the actual stop bar. A time delay may exist between actual status of airfield lights and panel lights in accordance with control methods described in AC 150/5340-28. The panel shall also include an alert control in the upper right hand corner. The alert control shall be a single push button, backlit red. Where applicable, lead-on lights will be represented by one green panel light located on the diagram for each segment of lead-on lights in a position relative to their position on the airfield. A typical panel is shown in Appendix IV, Figure 11 and the panel push button functions are described in Appendix I, Table 1.

## 5.3 Stop Bar Control Panel Design.

**5.3.1 Push Buttons.** Push buttons shall be used to control stop bar lighting systems and must be located on the stop bar control panel. The push buttons should be **softly** backlit in an “OFF” position and glow noticeably brighter in the “ON” position. All push buttons, with the exception of “ALERT”, “SENSOR OVERRIDE”, “UC STOPBARS”, and “LAMP TEST”, shall be alternate action push buttons with tactile feedback. The “ALERT”, “SENSOR OVERRIDE”, “UC STOPBARS”, and “LAMP TEST” push buttons shall be momentary action push buttons with tactile feedback. The push button controls and the panel layout should be designed to minimize the possibility of inadvertent activation; protective raised edges on at least two opposite sides, such that the push button will not be activated if a flat object weighing 2 pounds is dropped on it from a height of 3 inches. The ranges below are general guidelines for such controls; however, actual values to be used in a particular control tower are to be determined by the system designer/engineer. Air Traffic Control (ATC) personnel at the airport shall be consulted prior to final design and installation to verify that the control panel will meet the ATC requirements identified at that particular airport. The ranges are as follows:

Push Button Dimensions:	Minimum 3/8 inch (9.5 mm) • Maximum 1 inch (25 mm).
Lamp to Button Separation:	Minimum 1/2 inch (13 mm) • Maximum 2 inches (50 mm).
Button to Button Separation:	Minimum 1/2 inch (13 mm)
Resistance:	Minimum 10 oz. (2.8 N) • Maximum 40 oz. (11 N).
Displacement Height:	Minimum 5/64 inch (2 mm) • Maximum 1/4 inch (16 mm).

**5.3.2 Panel Illumination.** All panel lights shall be light emitting diodes (LED) or lamps with a minimum lamp life of 5,000 hours. The intensity shall provide a noticeable difference between "ON" and "OFF" under typical ATCT lighting conditions and when viewed between 0 degrees and 45 degrees from vertical. When the panel is activated, diagrams, indicator lamps, and push buttons shall be backlit. Backlighting shall not be more than 30% of the panel full lighting intensity. A panel lighting intensity switch shall be provided to vary the panel intensity between 50% and 100% intensity.

**5.3.3 Labeling.** The panel labels shall be in a simple, unadorned font and shall be located in consistent locations relative to each control/display. The relationship between the label and its associated control/display should be clear by virtue of their relative locations. All movement areas represented on the panel shall be labeled according to the airport nomenclature on the airport layout charts and signs. If necessary, to clarify the relationship between controls and displays, a line can be drawn around each associated pair of controls and stop bar indicators in a contrasting, neutral color. The stop bar alert control will be clearly labeled. The minimum character height is to be 0.18 inch (.7 mm). All characters should be capital letters and clearly viewed from 19.7 inches (.5 m) - 39.4 inches (1 m).

**5.3.4 Panel Functions.** Control push buttons on the stop bar control panel shall comply with the applicable functional descriptions in this section and Table 1, Stop Bar Panel Push Button Descriptions, in Appendix I.

**5.3.4.1 Controlled Stop Bars.** Panel functions of the panel buttons and status indicator lights are described in Appendix I, Table 1. AC 150/5340-28 contains more information on the normal operations of stop bars and the performance of the stop bar sensors.

**5.3.4.2 Uncontrolled Stop Bars.** When the panel is initially energized, the uncontrolled stop bars shall be energized. The uncontrolled stop bars shall be de-energized when the "UC STOP BARS" push button is pushed and shall become re-energized automatically in 30 seconds. If the push button is pushed again before the 30 second delay has expired, the uncontrolled stop bars shall become re-energized. The uncontrolled stop bars shall be electronically monitored if the status of uncontrolled stop bars is indicated with panel lights on the control panel (as shown in Figure 11).

**5.3.4.3 Alert.** Each stop bar control panel shall have an alert function, which indicates system malfunctions as described in the section of AC 120-57 that specifies the monitoring and visual inspection of lighting aids. This function shall be a red push button. To signal an alert condition is present, the alert push button shall be lighted and blinking, the appropriate red (stop bar) or green (lead-on) panel lights shall be blinking, and an audible tone shall sound. If the monitoring system is unable to detect and/or indicate which particular stop bar is malfunctioning, the alert push button shall be lighted and blinking, and an audible tone shall sound. A depression of this push button will indicate acknowledgement of the alert, and the push button will stop blinking and remain lighted and the tone shall cease. When the problem is corrected, the alert push button along with the stop bar and lead-on panel lights shall return to normal status.

## 6. EQUIPMENT QUALIFICATION REQUIREMENTS.

**6.1 Qualification Procedures.** Procedures for qualifying equipment to be furnished under the Federal grant assistance program for airports are contained in AC 150/5345-53.

**6.2 Qualification Tests.** The following tests shall be conducted on each panel to be qualified.

**6.2.1 Examination.** In this examination, use a check list to certify that the material used, dimensions, component parts, calibration, quantities, etc., are in accordance with the requirements of this specification as it applies.

**6.2.2 Operation.** Connect the panel to a test board consisting of pilot lights to check each component and switch for proper operation. Panels shall demonstrate compliance to all applicable operational requirements.

**6.2.3 Dielectric.** Subject all terminals on the terminal block to a potential of at least 500 volts rms, 60 Hz, applied between the terminal and the grounded case for a period of one minute. Any breakdown of the insulation will be cause for rejection.

**6.2.4 Humidity.** Subject all panels to a humidity test in accordance with **MIL-STD-810E**, Method 507.3, Procedure I. The equipment shall be subjected to three cycles (72 hours) according to Table 507.34, except the maximum temperature at cycle 1 shall be **+130°F (±5°) (+55°C)**. Failure of the equipment to operate as specified or any deterioration in material shall be cause for failure.

## **7. PRODUCTION TEST REQUIREMENTS.**

**7.1 Production Tests.** The following tests shall be conducted on each production panel.

**7.1.1 Examination.** In this examination, use a check list to certify that the material used, dimensions, component parts, calibration, quantities; etc., are in accordance with the detail requirements of this specification, as it applies and the purchase order.

**7.1.2 Operation.** Connect the panel to a test board consisting of pilot lights to check each component and switch for proper operation. Panels shall demonstrate compliance with all applicable operational requirements.

**7.1.3 Dielectric.** Subject all terminals on the terminal block to a potential of at least 500 volts rms, 60 Hz, applied for a period of one minute between the terminal and the grounded case. No breakdown of the insulation will be acceptable.

## APPENDIX 1. TABLE.

Table 1. Stop Bar Panel Push Button Descriptions.

The following table describes the functions and characteristics of the controls shown on the typical stop bar control panel shown in Figure 12. The table also describes the system and panel status operations associated with the system sensors. The sensors are described in detail in AC 150/5345-28.

Activation or DE-ACTIVATION <sup>1</sup>	Appearance	Function	Airfield Lighting and Panel Light Status <sup>2,3</sup>
<b>ALERT<sup>4</sup> (Red)</b>			
Automatic	Blinking	Indicates the system is malfunctioning. Malfunctions are defined in AC 120-57.	<i>Related Stop Bar - Blinking Related Lead On - Blinking</i>
MANUAL	Illuminated	Indicates acknowledgment of the malfunction.	<i>Related Stop Bar - Blinking Related Lead On - Blinking</i>
AUTOMATIC	Up-Illuminated	Indicates the system malfunctions have been corrected.	<i>Related Stop Bar - Blinking Related Lead On - Blinking</i>
<b>GO (Green)</b>			
Manual	Backlighted	Turns "OFF" associated Stop Bar	<i>Stop Bar - "OFF" Lead On (segment 1) - "ON" Lead On (segment 2) - "ON"</i>
AUTOMATIC (sensor)  Or  MANUAL	Illuminated	Turns "ON" associated Stop Bar	<i>Stop Bar - "ON" Lead On (segment 1) - "OFF" Lead On (segment 2) - "ON" Lead On (segment 2) - "OFF" when aircraft clears sensor #2  Stop Bar - "ON" Lead On (segment 1) - "OFF" Lead On (segment 2) - "OFF"</i>
<b>LAMP TEST<sup>4</sup> (White)</b>			
Manual	Illuminated	Illuminates all push buttons and indicator lights on the panel to full intensity.	Airfield Lighting - unchanged Panel lights - full intensity

<sup>1</sup> First letter CAPITAL indicates Activation and ALL CAPITAL LETTERS indicate De-activation.

<sup>2</sup> Italics indicate a change in lighting status.

<sup>3</sup> A time delay may exist between airfield lighting changes and panel indicator changes, per AC 150/5340-28.

<sup>4</sup> Momentary action push buttons.

Table 1. Stop Bar Panel Push Button Descriptions (continued).

Activation or DE ACTIVATION <sup>1</sup>	Appearance	Function	Airfield Lighting and Panel Light Status <sup>2,3</sup>
<b>SENSOR OVERRIDE<sup>3</sup> (White)</b>			
Manual	Illuminated	Overrides sensor commands when pressed along with the GO push button.	<i>Stop Bar - "OFF"</i> <i>Lead On (segment 1) - "ON"</i> <i>Lead On (segment 2) - "ON"</i>
MANUAL Or AUTOMATIC (timed)	Backlighted	Resets the associated Stop Bar.	<i>Stop Bar - "ON"</i> <i>Lead On (segment 1) - "OFF"</i> <i>Lead On (segment 2) - "OFF"</i>
<b>UC STOPBARS (Yellow)</b>			
Manual	Illuminated	All associated uncontrolled stop bars turned "OFF".	<u>Controlled Stop Bars</u> Stop Bars - unchanged Lead On (all) - unchanged  <u>Uncontrolled Stop Bars</u> Stop Bar - "OFF" Lead On (segment 1) - "ON" Lead On (segment 2) - "ON"
AUTOMATIC (timed) or MANUAL	Backlighted	All associated uncontrolled stop bars turned "ON".	<u>Uncontrolled Stop Bars</u> Stop Bars - "ON"  <u>Uncontrolled Stop Bars</u> Stop Bar - "ON" Lead On (all) - unchanged Sensor #1
<b>Sensor #1</b>			
Aircraft Crossing		Turns "OFF" segment 1 of Lead on lights.	Stop Bar - "ON" Lead On (segment 1) - "OFF" Lead On (segment 2) - "ON" Sensor #2
<b>Sensor #2</b>			
Aircraft Crossing		Turns "OFF" segment 2 of Lead on lights.	Stop Bar - "ON" Lead On (segment 1) - "OFF" Lead On (segment 2) - "OFF"

<sup>1</sup> First letter CAPITAL indicates Activation and ALL CAPITAL LETTERS indicate De-activation.

<sup>2</sup> Italics indicate a change in lighting status.

<sup>3</sup> A time delay may exist between airfield lighting changes and panel indicator changes, per AC 150/5340-28.

<sup>4</sup> Momentary action push buttons.

APPENDIX 4. FIGURES.

## APPENDIX 3. APPROVAL OF ALTERNATIVE PANEL LABELING.

The manufacturer shall submit to FAA **AAS-200** and, if applicable, the certification body providing the initial qualification of the panel, a request for approval of the alternative panel labeling method not mentioned in this specification. Requests should include a complete description of the labeling method, typical drawings, and other detailed information. **The third** party certification body will then evaluate the alternative labeling, with the necessary input **from** the FAA, to determine if it is acceptable. All alternate methods receiving approval will be shared with each of the approved third party certification bodies.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes the need for transparency and accountability in financial reporting.

2. The second part of the document outlines the various methods and techniques used to collect and analyze data. It highlights the importance of using reliable sources and ensuring the accuracy of the information gathered.

3. The third part of the document focuses on the interpretation and analysis of the data. It discusses the various statistical methods and models used to draw meaningful conclusions from the data.

4. The fourth part of the document discusses the implications of the findings and the potential impact on the organization. It highlights the need for strategic planning and decision-making based on the data.

5. The fifth part of the document provides a summary of the key findings and conclusions. It emphasizes the importance of ongoing monitoring and evaluation to ensure the effectiveness of the data collection and analysis process.

## APPENDIX 2. TERMS.

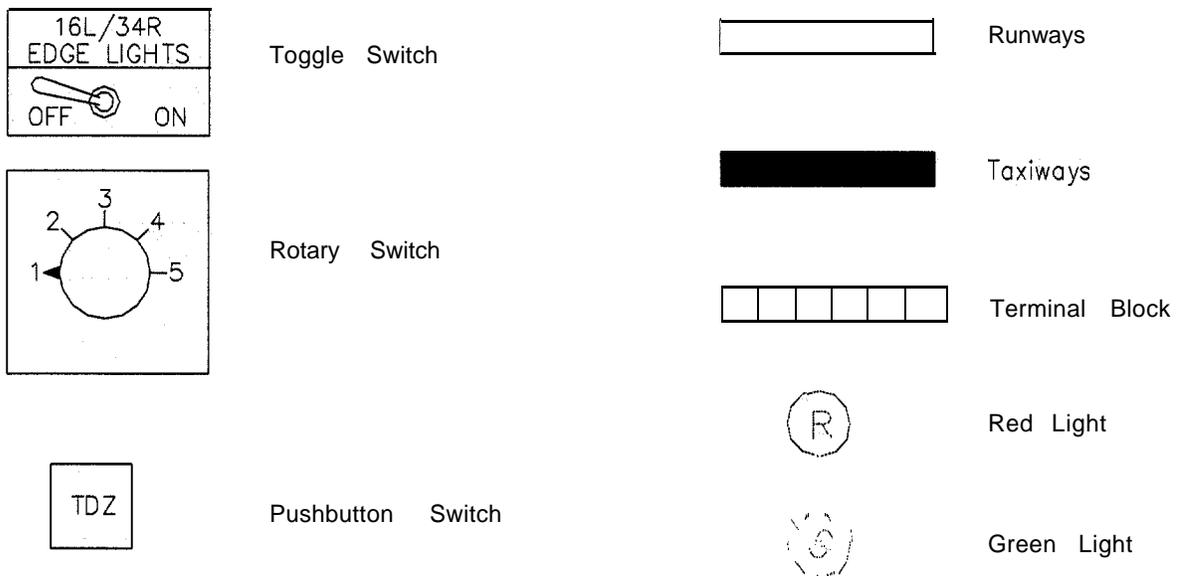

- A. Airport Grant Assistance Program. Programs that provide funding for airport planning and development projects at airports in the National Plan of Integrated Airport Systems (NPIAS).
- B. Alert Control. A single red backlighted push button control, that when pressed indicates that the controller has acknowledged the "ALERT" and is aware that a malfunction has occurred.
- C. Alternate Action (push buttons or toggle switches). When pushed in (push buttons) or toggled (toggle switches), the circuit locks in position. An additional push or toggle locks the circuit **in** the alternate position.
- D. Controlled Stop Bars. Stop Bars controlled individually by controls located on the stop bar control panel.
- E. Conventional Panel. Panels with switches and characters identifying the lighting system each switch controls.
- F. Facsimile Panel. Panels that include a graphic layout of the airport surface for the lighting systems controlled from the panel.
- G. Main Lighting Control Panel. The lighting control panel usually located in the airport traffic control tower which controls the airport lighting systems that do not require a dedicated panel.
- H. Momentary Push Button. Push buttons which close the circuit and turn "ON" the system simultaneous with the manual push of the button.
- I. RVR. Runway Visual Range
- J. Stop Bar. Stop bar lights consist of elevated and in-pavement red fixtures that are installed at **the** runway holding position or ILS critical area holding position marking. Stop bars may be controllable by ATC and will include a system of in-pavement green **taxiway** centerline/lead-on lights at locations where aircraft will enter or cross a runway.
- K. Surface Movement Guidance and Control System (SMCGS). – A SMCGS system consists of the provision of guidance to, and control or regulation of, all aircraft, ground vehicles and personnel on the movement area of an aerodrome. Guidance relates to facilities, information and advice necessary to enable the pilots of aircraft, or the drivers of ground vehicles to find their way on the aerodrome, and to keep the aircraft or vehicles on the surfaces or within **the** areas intended for their use. Control or regulation means the measures necessary to prevent collisions and to ensure that the traffic flows smooth and freely.
- L. Tactile Feedback. Providing a tangible reaction as a result of action, for example a "click" feel.
- M. Uncontrolled Stop Bars. Stop bars designated by the SMCGS plan to remain "ON" during SMCGS operation below 1200 RVR which are not individually controlled by ATC. Uncontrolled stop bars are turned "ON" and "OFF" by the SMCGS Master switch, located on the main lighting control panel, and may be temporally turned "OFF" **from** the stop bar control panel when a special need arises.
